

Media Engineering: A Guide to Developing Information Products

Drawing on the authors involvement with Encarta and implementing BTs on-line systems, this book explains how to go about designing and building volumes of assorted information into a coherent resource that is fit for consumption by a variety of users. The basic thesis of the book is that the core problems of designing multimedia information are amenable to the same concepts and disciplines that have been devised in software engineering. Furthermore it is not the technology of multimedia (compact disk, Internet, etc.) but the systematic structuring of information that really matters. This concept provides the focus for the problem-solving approach of the text.
