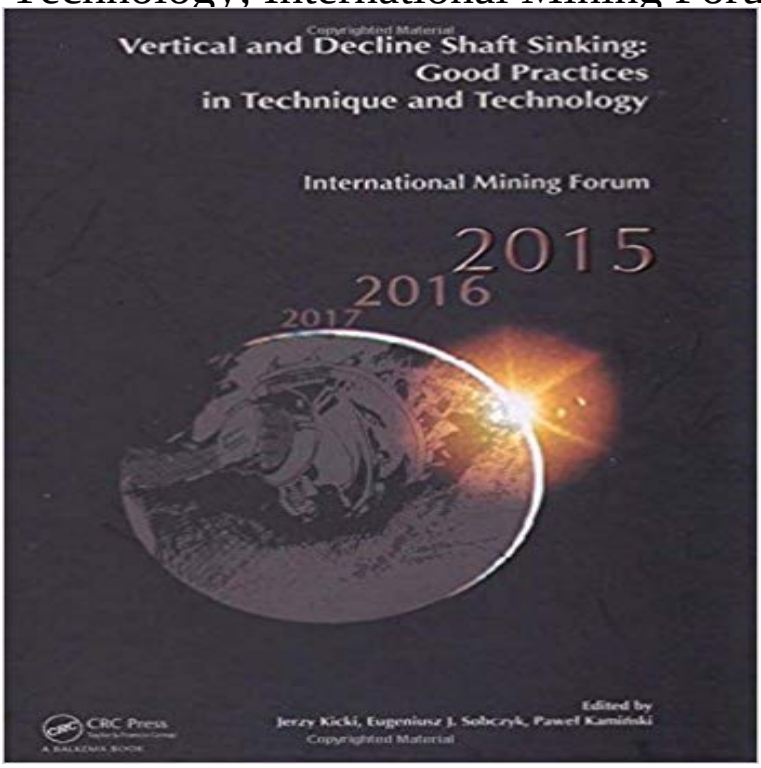
# Vertical and Decline Shaft Sinking: Good Practices in Technique and Technology, International Mining Forum 2015



Shaft sinking for underground transportation purposes is a verycomplex technological process in mining and geotechnology which requires specific and specially designed technological equipment.This technological processis dealt with for a long time, since mining is one of the oldest industries in the world.This book presents the technical papers that were presented at the International Mining Forum 2015. The International Mining Forum (IMF) is a meeting place of scientists and professionals who are engaged in confronting ideas and experience, evaluating solutions implemented, and discussing new ideas that might change the image of the mining industry. The IMF is an international activity of the School of Underground Mining, the major branch event organized both by the Mineral & Energy Economy Research Institute of the Polish Academy of Sciences and AGHUniversity of Science & Technology of Cracow, which gathering approximately 500 people from Poland and other countries every year. This years edition of the International Mining Forum wasrelated to specialistic underground construction. Experts presentedpapers related to the implementation and operation of the vertical and decline shafts. Experience from China, Germany, Serbia, Slovenia and Poland were shared at the meeting. The topics of papers submitted include: Application of TBM for driving declines shafts State-of-the-Art in Blind Shaft Drilling Ground freezing Technology of shaft sinking in low-strength rocks and high natural hazards probabilities Static calculations of the shaft linings Determinants of forecasting deformation in a shaft
